

STOCKPILE REPORT

to the Congress

JULY-DECEMBER 1966

**EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF EMERGENCY PLANNING
WASHINGTON, D. C. 20504**

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF EMERGENCY PLANNING

WASHINGTON, D.C. 20504

OFFICE OF THE DIRECTOR

April 17, 1967

Honorable Hubert H. Humphrey
President of the Senate

Honorable John W. McCormack
Speaker of the House of Representatives

Sirs:

Pursuant to Section 4 of the Strategic and Critical
Materials Stock Piling Act, Public Law 520, 79th Congress,
there is presented herewith the semiannual report to the
Congress on the strategic and critical materials stock-
piling program for the period July 1 to December 31, 1966.

A statistical supplement to this report was transmitted
to you on March 7, 1967.

Sincerely,

A handwritten signature in dark ink, appearing to read "Farris Bryant", is written over the typed name and title.

Farris Bryant
Director

SUMMARY

This report covers the principal activities in stockpile planning and management during July 1 through December 31, 1966, under the provisions of Public Law 520 (79th Congress), the Strategic and Critical Materials Stock Piling Act.

Nuclear war stockpile objectives were established for all strategic and critical materials included in the National Stockpile. The nuclear war objectives for the basic materials are less than or identical to existing conventional war objectives, with the exception of opium, where the nuclear objective is higher. A comparison of the conventional and nuclear objectives of all basic stockpile materials is shown on page 2.

Strategic materials on hand in all Government inventories as of December 31, 1966, amounted to \$7.2 billion at acquisition cost and \$6.8 billion at estimated market value. Of the total materials in Government inventories, \$4.0 billion at cost and \$3.5 billion at estimated market value are considered to be in excess of conventional war stockpile objectives. Comparison of the estimated market value of the objectives established and the extent to which materials on hand in all Government inventories meet these objectives are shown in the chart on page 5.

Cumulative sales commitments by the General Services Administration for the disposal of surplus materials as of December 31, 1966, totaled approximately \$2.5 billion at sales value. Disposal sales commitments during the July-December 1966 period accounted for \$204.7 million. This sales level is down from the record high of approximately \$582.2 million, established in the preceding six months period. (See Figures 1 and 2, page 12.)

INTRODUCTION

SUPPLY-REQUIREMENTS STUDIES— CONVENTIONAL WAR

During July-December 1966, new conventional war stockpile objectives were revised for several materials and a review of all stockpile objectives is planned for 1967.

Stockpile objectives are not static. Since they reflect the shortages—the difference between supply and requirements—that would exist in an emergency period, changes in either the estimated supply of or requirements for a material during the emergency period will require a review and possible revision of the stockpile objective.

Changes may take place gradually as the economy of the United States and the Free World grows or, for a particular material, may be abrupt because of new uses for the material (or reductions because of substitution of cheaper or better materials) or sudden changes in the available supply. In the latter instance, OEP reviews stockpile objectives for individual materials as the need arises. For the former case, periodic reviews are made of the stockpile objectives for all materials.

Reviews of stockpile objectives based upon new supply-requirements studies of conventional war were completed and indicated revisions in objectives were established for the following materials:

Material	Unit	Stockpile Objective	
		Prior	New
Bismuth	Lb	3,600,000	2,400,000
Feathers and Down	Lb	3,000,000	3,000,000
Magnesium . . .	ST	145,000	90,000
Molybdenum . .	Lb	55,000,000	40,000,000
Nickel	ST	50,000	20,000
Platinum	TrOz	450,000	335,000
Rutile	SDT	51,000	200,000
Titanium	ST	20,500	37,500
Vanadium	ST	1,400	1,500

In those cases where the new objective is less than the prior objective, programs are under development to dispose of any surplus materials generated by the change. Congress-

sional authority for disposing of these materials from the National Stockpile is required.

Publication by the Office of Business Economics, Department of Commerce, of the results of its "1958 Interindustry Relations Study" provided a new tool for estimating the total output levels that would be needed from various industries during an emergency period. This technique, when coupled with new data on the quantities of various materials required per unit of output from the various industries, provides improved procedures for computing the emergency requirements for stockpiled materials. On the basis of these new techniques, a complete review of all stockpile objectives is expected during 1967.

SUPPLY-REQUIREMENTS STUDIES— NUCLEAR WAR

At the end of 1966, nuclear war stockpile objectives had been determined for all materials classified as strategic and critical and included in the National Stockpile. This initial establishment of nuclear objectives was made possible after three years of study conducted by OEP with the assistance of various Federal departments and agencies. The study involved determinations of the essential programs that would have to be carried out following a nuclear attack on the United States and the ability of the potential postattack economy to provide the resources for these programs. Input-output techniques, utilizing the results of the Office of Business Economics, Department of Commerce "Interindustry Relations Study", were applied to insure that postattack programs were feasible and in balance.

The appropriate departments and agencies, primarily the Business and Defense Services Administration, using the results of the OEP study and the techniques developed, conducted special analyses of individual industries and prepared estimates of the potential postattack supply-requirements status for each of the 77 basic materials having conventional war objectives. The results of these analyses, coupled with data relating to the usage of the various materials, were used to determine the amounts of stockpiled material that would be needed for

each of the basic materials included in the National Stockpile. The amounts so determined constituted the nuclear war stockpile objectives for each of the materials. For all materials, except opium, these nuclear war objectives were less than or identical to existing conventional war objectives.

Present policy, as set forth in Defense Mobilization Order 8600.1, March 30, 1964, provides that: "... Strategic stockpile objectives shall

be adequate for limited or general, conventional or nuclear war, whichever shows the largest supply-requirements deficit to be met by stockpiling . . ." Accordingly, the higher objective is the controlling level for all actions relating to the material, such as acquisitions and disposals.

A comparison of the conventional and nuclear objectives of all basic stockpile materials follows:

COMPARATIVE SUMMARY

¹ Established January 5, 1967.

² Established January 13, 1967.

SUMMARY OF GOVERNMENT INVENTORIES OF STRATEGIC AND CRITICAL MATERIALS

As of December 31, 1966, the strategic materials held in all Government inventories amounted to \$7.2 billion at acquisition cost and \$6.8 billion at estimated market value. Of this total, \$4.7 billion at cost was in the National Stockpile, \$1.4 billion in the Supplemental Stockpile, \$1.1 billion in the Defense Production Act inventory, and \$5.4 million in the Commodity Credit Corporation inventory. Of the total materials in Government inventories, approximately \$4.0 billion at cost and \$3.5 billion at estimated market value are considered to be in excess of stockpile objectives. Over 83 percent of the market value of the total excess

is made up of 12 materials consisting of aluminum, bauxite (Jamaica and Surinam), metallurgical grade chromite, cobalt, industrial diamond stones, lead, metallurgical grade manganese, nickel, rubber, tin, tungsten, and zinc.

The following table is a summary of the total value of all materials carried in Government inventories, including those with quantities in excess of stockpile objectives for conventional war. It indicates the acquisition cost and estimated market value of materials with inventories meeting stockpile objectives, and materials with inventories excess to stockpile objectives.

SUMMARY OF GOVERNMENT INVENTORIES OF STRATEGIC AND CRITICAL MATERIALS

December 31, 1966

	Short Tons (In Millions)	Acquisition Cost	Market Value ¹
I. Total Inventories			
National Stockpile	24.3	\$4,674,483,100	\$4,791,986,900
Supplemental Stockpile	18.0	1,425,280,900	1,323,153,200
Defense Production Act	6.0	1,095,514,100	672,681,800
Commodity Credit Corporation0	5,436,800	5,608,200
Total on Hand	48.3	7,200,714,900	6,793,430,100
On Order1	40,254,100	41,730,000
II. Inventories Within Objective			
Total on Hand	27.3	3,203,494,900	3,341,399,100
III. Inventories Excess to Objective			
Total on Hand	21.0	3,997,220,000	3,452,031,000

Market values are computed from prices at which similar materials are being traded currently; or, in the absence of current trading, an estimate of the price which would prevail in commercial markets. The market values are generally unadjusted for normal premiums and discounts relating to contained qualities, so that market values are understated for materials such as metal grade bauxite to the extent that the inventories are of premium quality. The market values do not necessarily reflect the amount that would be realized at time of sale.

STATUS OF STOCKPILE OBJECTIVES

The bar chart below shows the estimated market value of the objectives established and the extent to which materials on hand in all Government inventories (National Stockpile,

Supplemental Stockpile, DPA, and CCC) meet these objectives. The figures do not include the quantities on hand in all Government inventories which are in excess of stockpile objectives (\$3.5 billion).

STATUS OF STOCKPILE OBJECTIVES

AS OF DECEMBER 31, 1966

(In Billions of Dollars)

MARKET VALUE

Inventories, including objectives, and balance of disposal authorizations, for each material on the Strategic and Critical Materials List are shown in the following summary. As of December 31, 1966, total quantities of stockpile grade materials on hand and on order for all Government-owned inventories are in excess or equal to the stockpile objectives for 64 of the 77 basic materials on the List of Strategic and Critical Materials for Stockpiling. In addition to the specification grade materials, Government inventories contain nonspecification grades not credited to stockpile objectives. Most of the nonspecification grade materials in the National Stockpile were acquired by the

transfer of Government-owned surpluses to the stockpile after World War II while others were accepted as contract termination inventories. Several were of specification grade when acquired but no longer qualify due to changes in industry practices and other technological advances. Disposal action for most of the excesses shown in the following summary has been authorized by the Congress or by OEP (in the case of DPA materials), while others are currently under disposal consideration. Inventory changes during the report period were due primarily to disposals, or to reclassification and other adjustments of the inventories.

¹ Total inventory consists of stockpile and nonstockpile grades.

² Includes quantities that have been committed but not shipped.

³ Committed for sale but undelivered under long-term contracts.

⁴ Uncommitted balance of excess held due to market impact.

⁵ Excess represents nonstockpile quality material not held for objective.

⁶ Congressional approval deferred due to market impact.

⁷ Balance of excess pending supply-requirements study.

⁸ Balance of excess pending present sales program.

Balance of excess retained (1) for refractory chromite deficit, and (2) due to high quality. Retained due to limited quantity.

Deferred due to foreign situation.

Balance of excess deferred by the Congress due to market impact.

⁹ Excludes 350,000 SDT credited to metallurgical fluorspar.

¹⁴ Factory inspecting feasibility of reworking bearings to meet stockpile specifications.

¹⁵ 7,640 SDT pending Congressional approval; 5,148 SDT pending supply-requirements study.

¹⁶ Objective filled from Treasury-held stocks.

¹⁷ Takes into consideration materials required in upgrading.

¹⁸ Excludes 1,086,960 LBS thorium nitrate credited as 500,000 LBS thorium oxide.

* Revised objective established in January 1967. See pages 2 and 3.

** Presidential Release.

OTHER MATERIALS IN GOVERNMENT INVENTORIES

In addition to inventories, including objectives, and balance of disposal authorizations

for each material on the Strategic and Critical Materials List, inventories covering materials that have been removed from the stockpile list, and others for which there are no stockpile objectives, are indicated in the table below.

SUMMARY OF GOVERNMENT INVENTORIES AND BALANCE OF DISPOSAL AUTHORIZATIONS COVERING MATERIALS FOR WHICH THERE ARE NO STOCKPILE OBJECTIVES

As of December 31, 1966
(Market Value—\$ Millions)

Commodity	Unit	Total Inventory ¹	Market Value	Balance of Disposal Authorizations

³ Pending Congressional action at adjournment, will require resubmission.

NATIONAL STOCKPILE ACTIVITIES

PROCUREMENT AND UPGRADING

The OEP Strategic Stockpile Procurement Directive for FY 1967 issued on September 7, 1966, and amended on November 17, 1966, directs the procurement of 11 strategic materials for the National Stockpile.

Only two of these—jewel bearings and copper—are to be acquired by expenditure of funds. Arrangements were made by the General Services Administration prior to December 31, 1966, to obtain the jewel bearings from the Government-owned facility at Rolla, North Da-

kota, under the Government's contract with Bulova Watch Company, Inc. The copper is to be obtained under the Defense Production Act Expansion Program, subject to certification of specific projects by OEP. An additional procurement program is under development. Following a new supply-requirements study, a revised stockpile objective of 200,000 short dry tons of rutile (previously 51,000 tons) was established on November 17, 1966. As of January 18, 1967, a Domestic Rutile Production Expansion Goal of 70,000 short tons per year was established. Current U.S. production is about 5,000 tons annually. To effect this expansion goal, OEP authorized the Department of the Interior to encourage the exploration, development and mining of stockpile grade rutile ores and concentrates and to recommend programs for DPA financing. OEP also authorized GSA to develop a Defense Production Act domestic purchase program for stockpile grade rutile ore and concentrates.

Four other materials—oxygen free high-conductivity copper, morphine sulphate, crystalline tungsten carbide, and hydrogen-reduced tungsten metal powder—are to be acquired by upgrading basic materials in the stockpile. On December 31, 1966, contracts had been entered into by GSA for the production of the OFHC copper and the morphine sulphate, under which the contractors will receive as full compensation, in lieu of cash, tin and raw gum opium, respectively, which are excess to the Government's requirements. Invitations for bids for the tungsten upgrading will be issued by GSA early in the calendar year 1967.

The 5 remaining materials—low iron chrysotile asbestos, corundum, palladium (in addition to a small quantity being upgraded), rutile, and selenium—are to be obtained under the Directive in exchange for surplus agricultural commodities under the barter program of the Commodity Credit Corporation, Department of Agriculture. No barter contracts for any of these materials had been executed by the CCC as of December 31, 1966.

JEWEL BEARING FACILITY

In November 1966, after Congressional approval of Public Law 89-784, the name of the Turtle Mountain Jewel Bearing Plant, Rolla,

North Dakota, was changed to the William Langer Jewel Bearing Plant in honor of the late Senator William Langer of North Dakota, who was largely responsible for the establishment of this industry in North Dakota.

During July-December 1966, the Bulova Watch Company, Inc., continued to produce jewel bearings for the stockpile and defense contractors. Both the stockpile contract and the lease for the property at Rolla, North Dakota, were extended through June 30, 1967.

Except for a few production and toolroom equipment units, deliveries of essentially all the modern jewel bearing production equipment has been completed. The assimilation of this equipment into the regular production stream has resulted in a marked improvement in production methods and techniques, and a steady increase in efficiency of operations with no significant increase in personnel. By December, the average production level had increased to approximately 50,000 jewel bearings per week from a weekly average of 30,000 about one year ago. The maximum installed production capability of the plant, by the end of the year, approached 7,500,000 jewel bearings per year on a one shift basis and 15,000,000 on a three shift basis.

At the end of the year, a restructuring and reduction of the price of jewel bearings were being considered. Draft legislation was being prepared to provide for a change in the method of operation of the plant. This legislation, if approved, would enable the use of operational flexibilities which would further increase efficiencies with a consequent reduction in cost of operations.

DISPOSAL PROGRAM ACTIVITY

Disposal sales and commitments in the July-December period totaled \$204.7 million as compared with the record sales of \$582.2 million during the previous six months when certain materials (copper, molybdenum, nickel, and platinum) were available from excess inventories to help relieve the heavy industrial demands stimulated by the Viet Nam build-up and rapidly expanding economy. Although these materials continued in critical supply during the July-December period, Government

sales were unavailable to aid in filling the gap when stockpile excesses became depleted, as indicated by the comparable sales.

1966 SALES AND COMMITMENTS (\$ Millions)		
	January-June	July-December
Copper	\$156.1	\$.02
Molybdenum	19.3	1.7
Nickel	126.9	25.9
Platinum	29.5	1.0
	\$331.8	\$28.62

Though the dollar value of sales during the reporting period (\$204.7 million) was lower than the comparable period in FY 1966 (\$446.0 million), actual disposal activity intensified in the period because disposal programs were conducted in 43 commodity areas compared with only 27 active disposals in the same period a year ago. The new programs involved numerous mineral and ore commodities which presented problems as complex, if not more so, than those associated with higher priced metals. The planning and implementation of 43 separate disposal programs imposed an administrative burden which is not apparent in the period's lower volume of sales proceeds.

As production capacity for some materials continued to fall short of consumer demands, steps were taken to increase disposal sales—often at the request of producers, processors and consumers—to avoid possible interruption of defense and essential civilian production and to alleviate hardship cases. Materials in short supply included aluminum, bismuth, copper, magnesium, mercury, molybdenum, nickel, platinum, tin, and vanadium. In the case of bismuth, magnesium, molybdenum, nickel, and platinum, additional quantities became available over and above stockpile needs as new conventional war requirements studies involving these materials were completed in late December and early January. At the year end, the following disposal plans were under consideration and for submission for Congressional approval early in 1967:

Material	Unit	National and/or Suppl Stockpiles	Estimated Value (Millions)
Bismuth	LB	1,200,000	\$ 4.8
Magnesium ..	ST	55,000	35.2
Molybdenum .	LB	15,000,000	24.3
Nickel	LB	60,000,000	50.0
Platinum	TrOz	115,000	12.6
Rare Earths ..	ST	7,640	3.4
			\$130.3

As indicated in the previous report, OEP authorized disposals and GSA completed the disposal programming for practically all excesses in Government inventories prior to June 30, 1966, with the exception of five materials—two (cobalt and diamond bort) were deferred because of market impact, and three (pyrethrum, sperm oil and tantalum) pending supply-requirements studies.

All disposal programs provide for continuous scrutiny in consultation with interested Federal agencies to insure that the mutual interests of industry, foreign Governments and the U.S. Government are fully protected in accordance with the requirements set forth in DMO 8600.1. Accordingly, reviews of sales plans and related matters were conducted during the period with respect to cordage fibers, beryl, cobalt, manganese ores, mercury, nickel, rubber, and tungsten ores and sales rates were adjusted in keeping with market conditions.

During July-December, OEP arranged for the release of 3 programs—24.5 million pounds of nickel, valued at \$19.0 million, remaining as surplus following an earlier cutback in Congressional authorization (November 1965); 25.1 million pounds of cobalt, valued at \$41.4 million, previously deferred from the Defense Production Act inventory due to market impact; and 150,000 tons of copper, valued at \$112.5 million, which the President released from the National Stockpile on December 2, 1966, for purposes of the common defense as provided under Section 5 of the Strategic and Critical Materials Stock Piling Act, as amended. This action was taken at the recommendation of the Director of the Office of Emergency Planning and the recommendations of

MILLION DOLLARS

FIGURE 1

MILLION DOLLARS

the Secretaries of the Treasury, Defense, and Commerce, the Acting Secretary of State, and the Chairman of the Council of Economic Advisers. The distribution of this copper is restricted to domestic consumers for defense-rated orders only.

LEGISLATION RELATIVE TO STOCKPILE DISPOSALS

Prior to adjournment, the Congress enacted legislation authorizing the sale of five stockpile materials—fused aluminum oxide, industrial diamond stones, synthetic battery grade manganese, metallurgical manganese, and nickel—with an estimated market value of about \$135.8 million. During the two years of the 89th Congress, a total of 43 disposal bills in-

volving the release of 56 surplus materials from the National and Supplemental Stockpiles were submitted for consideration and, of this total, 38 bills (covering 40 disposal bills) were enacted covering 52 strategic commodities, valued at approximately \$1.8 billion in disposal sales. As of December 31, 1966, actual sales or commitments against these authorizations amounted to about \$641.5 million. This performance was made possible through the cooperation and dispatch with which the Congress considered and passed the necessary legislation.

The three bills awaiting Congressional action at the time of adjournment were metallurgical bauxite (Jamaica and Surinam), diamond tools, and silicon carbide.

LEGISLATION RELATIVE TO STOCKPILE MATERIALS

July—December 1966

Material	Unit	Quantity	Value (\$ Million)	Date Enacted
Aluminum oxide, fused, crude	ST	130,000	\$18.7	PL-724 11-2-66
Diamond stones, industrial	KT	1,800,000	23.3	PL-723 11-2-66
Manganese, battery, synthetic	SDT	14,572	9.0	PL-726 11-2-66
Manganese, metallurgical	SDT	1,900,000	65.8	PL-539 8-19-66
Nickel	LB	24,500,000	19.0	PL-740 11-2-66

SALES COMMITMENTS

During July-December 1966, disposal sales commitments totaled approximately \$204.7 million at sales value (Figure 1). Of the total sales commitments, \$138.7 million were from the National and Supplemental Stockpiles, \$63.0 million from the Defense Production Act Inventory, and about \$3.0 million from sales of mercury from the Federal Property Act Inventory. These materials had an acquisition cost of \$241.3 million. Commercial sales accounted for \$171.2 million of the total sales commitments and Government-use programs amounted to \$33.5 million, an increase of \$9.6 million over the previous period. The increased Government utilization of excess raw materials was the result of OEP and GSA efforts to establish Government-use programs with agencies such as

the Agency for International Development and the Department of Defense.

Total sales commitments for the previous six months were about \$582.2 million, making the total for calendar year 1966, \$786.9 million. Cumulative disposal sales commitments since the inception of the disposal program in 1958 total approximately \$2.5 billion at sales value (Figure 2). The following materials made up approximately \$177.9 million of the total sales for the July-December period: aluminum, \$41.3 million; columbium, \$6.3 million; lead, \$12.1 million; magnesium, \$7.4 million; nickel, \$25.9 million; rubber, \$39.6 million; tin, \$24.7 million; tungsten, \$10.0 million; vanadium, \$7.3 million; and zinc, \$3.3 million.

A list of the materials sold during the report period is shown in the following table:

NOTES ON STRATEGIC AND CRITICAL MATERIALS JULY-DECEMBER 1966 ACTIVITY

Aluminum

Under the long term contractual arrangement entered into in November 1965-January 1966, between General Services Administration and six domestic and one Canadian primary aluminum producers—Aluminum Company of America, Kaiser Aluminum & Chemical Corporation, Reynolds Metals Company, Olin Mathieson Chemical Corporation, Harvey Aluminum, Revere Copper and Brass Incorporated and Alcan Aluminium Limited—the producers agreed to purchase a minimum of 150,000 tons of aluminum for the period November 1, 1965, to December 31, 1966, and 100,000 tons annually thereafter, until the total 1.4 million tons surplus is exhausted.

During the 13 month period ending December 31, 1966, industry purchased a total of 357,294 tons, valued at \$175.7 million, to meet the growing demands for aluminum products resulting from the Viet Nam war and civilian economy. Of the total, approximately 83,875

tons were committed during the July-December period at a value of \$41.3 million. These Government disposals provided critically needed supplies at a time when growth in productive capacities was unable to keep pace with the mushrooming requirements for aluminum.

Castor Oil

Disposal offerings are made on a sealed-bid basis at 2-month intervals. All of the offerings were oversubscribed, and sales totaling approximately 18.2 million pounds, valued at \$2.6 million, approached the maximum allowable under the terms of the program. This high rate of sales was more than twice that of the preceding 6-month period, which may be explained by the substantial drop in Brazilian production. The cumulative total sold since the first sale of August 15, 1962, amounts to 81.8 million pounds with a cumulative sales value of \$11.6 million, leaving 73.8 million pounds remaining unsold from the 1962 authorization

and another 46.0 million pounds excess in the stockpile awaiting GSA submission to the Congress for disposal consideration.

Cobalt

A disposal program was authorized on August 23, 1966, for approximately 25 million pounds of excess cobalt in the Defense Production Act inventory. The initial sale on September 20, 1966, offered one million pounds on a sealed-bid basis. Since this test offering revealed fairly strong demand, GSA reviewed the disposal plan with other agencies and revised the plan on November 9, 1966, to provide disposal of three million pounds in fiscal year 1967. By December 31, commitments totaled approximately 1.5 million pounds, valued at \$2.3 million. At the end of the period, indications pointed to a critical supply shortage of cobalt which could result in heavy industry reliance on the stockpile disposals and substantial increases in the sales rate prior to June 30.

Columbium

Sales were heavy throughout the period because of the extremely tight market for tantalum which is physically associated with the predominately columbium ore. The best response to the sealed-bid offerings was registered in the first half of the period prior to the depletion of the excess high tantalum-bearing columbite. By the end of the period, however, the severity of the tantalum shortage was such that there was extremely good demand for columbite containing less than 10 percent tantalum. Columbium sales for the period totaled approximately 945,000 pounds valued at \$6.3 million.

Copper

As the availability of refined copper continued to fall well behind the constantly growing industrial consumption, the President, on December 2, 1966, determined that the release of an additional 150,000 short tons of copper from the National Stockpile was required for purposes of the common defense, as provided under Section 5 of the Strategic and Critical Materials Stock Piling Act, as amended. This is the third Presidential release of copper totaling 550,000 short tons from the National Stockpile since November 18, 1965, and re-

duces the stockpile to about 259,000 tons against an objective of 775,000 short tons. The 150,000 tons are to be prorated to producers over the first nine months of calendar 1967 on the basis of their 1965 production for redistribution to domestic consumers for defense rated orders only, at no added cost. Government releases are planned for 22,000 tons each in January, February, and March; 20,000 tons each in April and May; 13,000 tons each in June and July; and 9,000 tons each in August and September.

In accordance with OEP's recommendation of March 17, 1966, which the President approved March 21, 1966, GSA has undertaken to expand domestic production of copper through the use of special incentives on a selective basis. At the year end, GSA had negotiations under way covering potential production of over 50,000 tons of copper per year from Arizona ores. It is estimated that nominal production could start in 1969. This project could involve private and/or Federal financing of about \$130 million supported by a Defense Production Act purchase contract.

Lead

Sales were generally steady throughout the period, totaling 43,293 tons valued at \$12.1 million. This level of sales did not change appreciably from the preceding period.

Magnesium

Disposal sales under the magnesium program reached their highest point during the July-December period, totaling 12,178 tons valued at \$7.4 million. The market had grown increasingly tight throughout 1966 as demand was spurred by new commercial uses and increased military consumption. Unfortunately, when demand reached its highest rate in the first two months of the period, excess availabilities had reached a point approaching depletion.

GSA convened a Government-industry meeting on September 21, to determine the most effective means of rationing the remaining 5,300 tons of excess. The industry expressed satisfaction with the handling of the disposal program, but was concerned over GSA's impending withdrawal from the market at a time of growing shortages.

As a result of new supply-requirements studies completed in late December, 55,000 additional short tons of magnesium were determined excess to stockpile needs and a disposal plan for submission to the Congress was under development at the year end. It is planned that commercial sales will be offered at the rate of approximately 5,000 short tons annually with additional quantities available for term contracts with primary magnesium producers.

Molybdenum

The Congress authorized the release of 14 million pounds of surplus molybdenum from the National Stockpile (PL 89-413) in May 1966. To effect equitable distribution in the face of the critical supply shortage, industry concurred that the material should be allocated by BDSA against consumer applications for domestic consumption only with priorities given to defense-rated orders and alleviation of hardship, particularly for small business. During the May-December period, sales commitments totaled 12.5 million pounds, valued at \$21 million, of which 8.8 million pounds went to producers (roasters) for processing, subject to BDSA allocations to consumers. As of December 31, 1966, approximately 3.6 million pounds of the quantity processed by roasters remain to be allocated. Another 1.5 million pounds are available from the stockpile, making a total of 5.1 million pounds awaiting allocation by BDSA at the year end.

On the basis of new supply-requirements studies completed in late December, another 15 million pounds of molybdenum became available for release subject to Congressional approval.

Nickel

On November 2, 1966, the Congress authorized the sale of 24.5 million pounds of surplus nickel (PL-740) remaining in the National Stockpile when the Congress amended the previous authorization to 200 million pounds (PL-323, November 5, 1965). Due to the continuing market shortage, this nickel is restricted for domestic consumption only and will be distributed on the basis of 90 percent for defense-rated orders and 10 percent for the alle-

viation of hardship particularly for small business. Offerings are being allocated at a monthly rate by Business and Defense Services Administration, Department of Commerce.

During the reporting period, demand for nickel continued to be extremely heavy, due to the Viet Nam buildup and commercial requirements. Sales commitments of nickel available for release totaled only 32.6 million pounds, valued at \$25.9 million, as compared to 173.5 million pounds, valued at \$126.9 million in the January-June period. Disposal sales played an important role in alleviating potential cutbacks in producer's supply of nickel critically needed to meet defense and essential civilian production. On the basis of new conventional war requirements studies completed in late December, an additional 60 million pounds of nickel became available for disposal pending Congressional approval. The release of this material will be extended over several months on the basis of allocations furnished by BDSA with 50 million pounds reserved to fill DOD rated orders and 10 million pounds set aside for small business and special hardship cases.

Rubber

Government sales of rubber have continued at a high rate during the report period. Sales for July-December 1966 totaled 84,986 long tons, valued at \$39.6 million. Of this total, approximately 25,804 tons, valued at \$12.7 million, were commercial sales and 59,182 tons, valued at \$26.9 million, were for Government-use programs. Of the 59,182 tons, AID programs accounted for 19,976 tons and other Government programs, including DOD truck and aircraft tires, and retreading programs 39,206 tons.

In view of the continued price decline of rubber in the world market during the July-October period and in the interest of improving the U.S. relations with the producing countries, the Government announced on October 18, 1966, that disposals from the stockpile would be reduced to the quarterly rate of 30,000 long tons, or 120,000 tons annually, rather than the previous rate of 170,000 tons. Of the 30,000 tons quarterly, 6,000 tons are being set aside for commercial sales, 6,000 tons

for foreign AID programs, and 18,000 tons for defense contracts and other Government programs. The requirements contained in DOD contracts for certain rubber articles, specifying that 50% of the contract value must be purchased in the form of stockpile rubber, remain unchanged.

Tin

Tin remained one of the major revenue producers, although shelf sales were down one-third from the previous six months. The cause of slower sales was the narrowing gap between production and demand due to a leveling of consumption rates and increased production. Sales of tin from the National Stockpile totaled approximately \$24.7 million for 7,159 tons. Government-use of tin accounted for approximately \$4.6 million of the total sales. Since tin disposals were initiated in September 1962, cumulative sales have amounted to 81,239 long tons, valued at \$280.6 million. As of December 31, 1966, approximately 66,760 long tons remained available for disposal under the Congressional authorization.

Tungsten

The world supply situation for tungsten grew increasingly tight throughout the period. Based on the supply-demand outlook, the Government announced in July that commercial sales availability of tungsten through December 31, would be approximately 3.5 million pounds of tungsten. Shelf sales were heaviest in October, when many major domestic con-

sumers turned to the stockpile to support their requirements. Sales in the report period totaled 3.9 million pounds, valued at \$10.0 million. To meet the growing domestic shortage caused by the strengthening of world markets, the Government announced in November 1966, that tungsten would continue to be offered as a shelf item but on an unrestricted sales basis through June 1967.

Vanadium

Vanadium supplies continued to be critically short during the period, and the National Stockpile excess became again an important source for this vital metal alloy additive. During the period, approximately 1,681 short tons were sold to the consuming industry for a total of \$7.3 million.

Disposals of approximately 3,346 short tons of vanadium in calendar year 1966 represented approximately 60 percent of the estimated U.S. consumption for the year. Except for the stockpile disposal program, the domestic consuming industry would have undoubtedly suffered.

Zinc

Shelf sales in the period totaled 11,140 tons, valued at approximately \$8.3 million. This level of sales represents only 25 percent of the stockpile sales in the prior 6-month period. Import quotas for zinc were terminated in late 1965 resulting in increased imports of metal during the period.

ACTIVITIES OF THE GENERAL SERVICES ADMINISTRATION RELATING TO STOCKPILING OF STRATEGIC AND CRITICAL MATERIALS

The General Services Administration is charged with the general operating responsibility, under policies set forth by OEP, for stockpile management, including (1) purchasing and making commitments to purchase, transferring, rotating, upgrading, and processing of metals, minerals, and other materials; (2) expansion of productive capacity through the installation of additional equipment in Government-owned plants and the installation of Government-owned equipment in privately-

owned facilities; (3) storage and maintenance of all strategic materials held in Government inventories, and (4) disposal of excess stockpile materials, including the development of disposal plans, selling the materials, and arranging for Government use of such materials.

The activities of the General Services Administration particularly in connection with procurement, upgrading, and disposals have been summarized in the earlier sections of this report.

STORAGE AND MAINTENANCE

On December 31, 1966, approximately 48.3 million tons of strategic materials were stored at 150 locations, as follows:

Type of Facility	As Of 12/31/66	Change in Last 6 Months
Military depots	43	-2
GSA depots	27	+1
Other Government-owned sites	15	+1
Leased commercial sites..	14	-1
Industrial plantsites	39	-1
Commercial warehouses .	12	0
Total	150	-2

The Defense Supply Agency depot in Terre Haute, Indiana, and the Naval depot in Hastings, Nebraska, were inactivated by the military and transferred to GSA on July 1, 1966. Custody of stockpile materials stored at these locations is now under GSA.

An industrial plantsite location in Danville, Illinois, was completely evacuated by the sale of refractory bauxite stored thereon.

Shipments from the stockpile continued at a heavy rate as 666,000 tons of materials were shipped from storage locations during the peri-

od. The total of 1,598,000 tons shipped during calendar year 1966 more than doubles the 694,000 tons shipped during 1965. Outshipments during the past four periods were as follows:

Period	Tons
January-June 1965	403,000
July-December 1965	291,000
January-June 1966	932,000
July-December 1966	666,000

Inventory reductions due to disposal shipments in the period resulted in a projected savings in recurring storage costs exceeding \$150,000 per year.

INSPECTION

The systematic inspection of stockpiled commodities by the Inspection activity of GSA continued with many comprehensive quality evaluations being conducted for specific commodities. The Inspection activity increased its participation in the area of disposal planning and sales, conducting a total of 11,250 inspections related to disposal actions. This inspection attention assured the proper quality identification of materials in disposal planning, and the inspections on outloading assured that the consuming plants received only materials of the specified quality and weight.

ACTIVITIES OF THE DEPARTMENT OF COMMERCE RELATING TO STOCKPILING OF STRATEGIC AND CRITICAL MATERIALS

The Department of Commerce has been delegated a number of responsibilities with regard to the National Stockpile and these in turn have been assigned to the Business and Defense Services Administration within the Department. BDSA prepares for the Office of Emergency Planning estimates of essential civilian and war-supporting requirements for strategic materials in a mobilization period, a basic element in determining stockpile objectives. In certain limited cases, it also prepares estimates of the mobilization supply of such materials. It reviews plans for disposal of surplus stockpile materials and it provides OEP and GSA with its evaluation of the market impact of proposed schedules of sales. In addition, it develops recommendations in the mat-

ter of purchase specifications and storage procedures. Finally, it prepares special studies for OEP regarding strategic material problems and, in general, submits to OEP, on behalf of the Department, recommendations and advice on stockpile policies and programs.

ESSENTIAL CIVILIAN AND WAR-SUPPORTING REQUIREMENTS

During the period, OEP completed its study of methods and guidelines for estimating requirements in a nuclear war situation. BDSA used the guidelines as a basis for developing essential civilian and war-supporting requirements in a nuclear war situation for materials in the National Stockpile list. These estimates were submitted to OEP by early December to

permit determination of nuclear war stockpile objectives prior to January 1, 1967.

In addition to the requirements studies for nuclear war objectives, BDSA reviewed requirements estimates for a conventional war situation for the following stockpile materials: bismuth, celestite, magnesium, molybdenum, nickel, platinum, rutile, silicon carbide, and titanium.

DISPOSAL PROGRAMS

During December 1965-June 1966, proposed disposal programs for almost all of the remaining surpluses in Government inventories were reviewed and comments or recommendations were sent to GSA. Since most of these programs incorporated a requirement for annual reviews, disposal recommendations in the second half of 1966 covered primarily those programs in need of revision by reason of changes in market activities. Accordingly, reviews of sales programs, including rates of sale, involved abaca, beryl, cobalt, manganese ore, mercury, nickel, quartz crystals, rare earths, and tungsten ores and concentrates.

NATIONAL STOCKPILE PURCHASE SPECIFICATIONS AND SPECIAL INSTRUCTIONS

The program for review of all stockpile purchase specifications and special instructions over a two-year period began to be activated in the fourth quarter of 1966. The importance of this review is accentuated by accelerating technological trends in the use of metals, minerals and other materials which could render obsolete forms in which stockpile inventories are being held. The complexity of some specifications is such that more than one industry survey and many interagency reviews are necessary before a generally acceptable formula can be devised. During the report period, the following revisions of purchase specifications and special stockpile instructions were issued:

<i>Purchase Specifications</i>	<i>Special Instructions</i>
Ferrocolumbium	Tungsten ores and concentrates
Tungsten ores and concentrates	

SPECIAL STOCKPILE STUDIES AND RELATED ACTIVITIES

Copper.—On March 21, 1966, the President approved the release of 200,000 short tons of refined copper from the National Stockpile under the authority of Section 5 of the Stock Piling Act. The copper was to be sold at 36¢ per pound for domestic consumption only. During the second quarter, GSA sold 96,700 tons to producers who redistributed the material in accordance with instructions from BDSA. These instructions involved allotments to consumers which would fulfill defense orders and ease hardship cases.

At the end of the second quarter and in the beginning of the third quarter, BDSA reviewed applications for purchases of the remaining copper in the third quarter. After appropriate screening, BDSA made allotments of 64,245 tons to cover defense orders and 39,055 short tons to meet domestic hardship requirements. As before, BDSA instructed producers as to allotments for each consumer. The producers were instructed to fill consumer orders from the Government stocks they had purchased. These quantities completed the distribution of the entire 200,000 tons.

On December 2, 1966, the President authorized the release of another 150,000 short tons of refined copper from the Government stockpile.

BDSA, in cooperation with other Government agencies, formulated plans for release of this copper. Under BDSA instructions, the total quantity will be sold by the General Services Administration to producers of refined copper from domestic ores, for resale to copper producers to fill defense-rated orders only.

The release schedule during 1967 will be as follows:

January through	
March	22,000 tons each month
April and May . .	20,000 tons each month
June and July . .	13,000 tons each month
August and	
September	9,000 tons each month

GSA executed contracts with each participating producer in January 1967.

Molybdenum.—In May 1966, the Congress approved the disposal of 14 million pounds of

surplus molybdenum from the National Stockpile. By direction of OEP, BDSA surveyed the market and prepared instructions for the allocation of 4.3 million pounds to consumers in May and June to fill defense orders and to replace depleted inventories. Deliveries were also made to producers (roasters) who agreed to process the material for redistribution to consumers subject to BDSA allocations. On the basis of applications filed by consumers for the July-September quarter, BDSA issued approximately 150 allotments to the General Services Administration and to participating roasters covering about one million pounds for defense-rated orders and one million pounds for hardship cases. In the fourth quarter, BDSA provided allocations for another 1.2 million pounds for defense-rated orders and 1.4 million pounds for hardship cases. All molybdenum sales during the May-December period were restricted to domestic consumption. As of December 31, 1966, approximately 5.1 million pounds of the original 14 million pounds remained to be distributed.

Nickel.—The distribution plan of surplus nickel from the National Stockpile, as authorized by the OEP under PL 89-740, was announced by the Department in December 1966. The 24.5 million pounds available for release are being distributed on the basis of 90 percent (22.5 million pounds) for defense-rated orders and 10 percent (2.0 million pounds) for nondefense hardship, particularly the needs of small business. Furthermore, all nickel distributed must be consumed domestically. About 6.325 million pounds were allocated for use in December, of which 5.1 million pounds were to fill defense-rated orders and 1,225,000 pounds were for hardship cases. The remainder of the set-aside for hardship cases will be allocated in January.

Allocation of stockpile nickel to fill defense-rated orders is being made only in those cases requiring 50,000 pounds or more of the material. Persons having less than this minimum defense requirement must place rated orders with their suppliers under applicable BDSA regulations.

Rubber.—In connection with the development of a nuclear war stockpile objective, a special report was prepared for OEP providing up-to-date information on stereo rubber plants,

including present and prospective capacity production of each and the location of the plants.

Palladium.—The Office of Emergency Planning advised the Department on October 3, 1966, that the U.S. Mint had declared 4,392 ounces surplus to its needs. In light of the need for this material to lessen the deficit against the stockpile objective and a provision in the Stock Piling Act authorizing the transferral of such surpluses to the stockpile, if not needed to make up a deficiency of supply for industrial requirements, OEP requested the Department to make a determination regarding the need of industry for this quantity.

After consultation with industry representatives and an evaluation of the market, BDSA prepared a statement that there was not at that time a deficiency in the supply of palladium for the current requirements of industry such as would warrant exempting the palladium in question from the required transfer to the stockpile.

Refractory Chromite.—Because of the deficit of 200,000 short tons against the stockpile objective for refractory chromite and the difficulty in acquiring additional supplies as the traditional sources became depleted, OEP requested BDSA to review on an interagency basis the feasibility of using friable Transvaal chromite for this purpose. If found suitable, the availability of surplus material of this type in the chemical grade chromite inventory would make further purchases of refractory grade chromite unnecessary.

In studying this situation, current use of friable chromite for refractory purposes was analyzed, the need for special equipment for such usage was determined and total consumption of both types was ascertained. In addition, industry was consulted regarding the comparability of friable chromite refractory brick with nonfriable refractory grade chromite brick.

Based on this study, it was concluded that the friable ore could be satisfactorily used in a number of cases. Accordingly, BDSA prepared for OEP drafts of special stockpile instructions which would permit crediting to the refractory grade chromite objective, a sufficient quantity of the surplus friable ore in the chemical grade chromite inventory to complete the refractory grade chromite stockpile objective.

ACTIVITIES OF THE DEPARTMENT OF STATE RELATING TO STOCKPILING OF STRATEGIC AND CRITICAL MATERIALS

The Department of State provides advice and guidance in regard to the effects of stockpile program activities on our foreign relations and deals with international relations problems arising out of these activities. The Department helps to assess the availability of strategic and critical materials from the primary producing countries and the reliability of these sources in time of national emergency. It participates in a review of the supply and demand situation for each of the strategic materials and helps to develop stockpile objectives.

The Department shares in the development of long-range plans for the disposal of surplus materials and conducts consultations with interested foreign governments on proposed disposals. Based on these consultations, an evaluation is made of the political and economic effects of such plans on friendly foreign countries and on the foreign relations of the United States. As necessary, the Department makes

recommendations for the adoption or modification of proposed disposal plans.

The Department reviews proposals for the barter of United States surplus agricultural commodities for strategic materials. It also assists and advises the Department of Agriculture on foreign policy problems arising from the implementation of barter programs.

During the period July through December 1966, the Department conducted numerous consultations on new disposal plans and on modification of existing programs. For example, extensive consultations were held with the interested foreign governments and with the international organizations dealing with tin and rubber on the disposal programs for these materials. The Department received and handled such adverse foreign reactions to our disposal programs as arose and gave advice on new foreign policy development which had a bearing on already existing programs.

ACTIVITIES OF THE DEPARTMENT OF AGRICULTURE RELATING TO STOCKPILING OF STRATEGIC AND CRITICAL MATERIALS

TRANSFERS FROM STOCKPILE FOR DISPOSAL

No foreign-grown extra-long staple cotton remained in the National Stockpile inventory as of December 31, 1966. Domestic-grown extra-long staple cotton remaining in this inventory amounted to 36,341 bales at the end of 1966.

In 1962, General Services Administration transferred all National Stockpile extra-long staple domestic and foreign-grown cotton to the Commodity Credit Corporation. This involved about 123,000 bales (running) of Egyptian and Sudanese cotton. The 15,115 bales of this foreign-grown cotton on hand July 1, 1966, have been disposed of through an export sales program, reducing the inventory to zero.

The GSA transfer to CCC involved 47,518 bales of domestic cotton which were added to the CCC inventory, making a total of 53,740 bales. Sales from this have been for unrestricted use. Cumulative sales through June 30, 1966, were 15,263 bales. Sales during the peri-

od July-December 1966 amounted to 2,136 bales, leaving an inventory of 36,341 bales.

EXPANSION OF DOMESTIC SOURCES

To insure a basis for minimum emergency production requirements, a supply of viable seed of eight varieties or strains of opium poppy seed is maintained. Strain M92 was grown at Mesa, Arizona and seed sent to the National Seed Storage Laboratory in 1962. Germination of stored seed has been so good that it seems inadvisable to make an increase each year. As a result, no poppies are being grown for 1967 harvest.

FOREST PRODUCTS AND WOOD UTILIZATION RESEARCH

Improved techniques developed through packaging research may have application in the handling and maintenance of stockpile materials. For example, research involving methods of improving the moisture resistance of corrugated containers indicated significant

promise through use of paper treated with phenolic resins. Recent studies indicate the best method of avoiding embrittlement caused by resin impregnation may be to laminate treated and untreated paper. It has been demonstrated that low-density polyethylene used as a laminating adhesive results in laminates of maximum flexibility. Coupled with this, an increased amount of low-molecular weight, water soluble phenolic resin in the treated ply provides maximum strength.

A digital computer will be used to facilitate the evaluation of cushioning characteristics of corrugated pads. The studies involve an almost limitless number of combinations of materials, configurations, and orientations possible in built-up pads of fiberboards.

BARTER ACTIVITIES

The barter program of the U.S. Department of Agriculture exchanges agricultural commodities for foreign-produced strategic and other materials for stockpiling and for foreign mate-

rials, goods and services required abroad by other U.S. Government agencies. Barter transactions are transacted mainly under authority of the Agricultural Trade Development and Assistance Act of 1954, as amended (P.L. 480, 83rd Congress) and the Commodity Credit Corporation Charter Act, as amended.

There were four barter contracts for strategic materials valued at \$8 million signed during the period July-December 1966. These contracts provided for processing into beryllium metal of Indian beryl ore being delivered under a bilateral U.S. - Indian barter transaction.

Strategic materials valued at \$18.5 million were delivered to CCC during the period July-December 1966, bringing the cumulative total of deliveries to CCC under barter contracts since 1950 to approximately \$1.6 billion. Of this total, \$223.3 million were transferred to the National Stockpile and about \$1.4 billion to the Supplemental Stockpile through December 31, 1966.

ACTIVITIES OF THE DEPARTMENT OF THE INTERIOR RELATING TO STOCKPILING OF STRATEGIC AND CRITICAL MATERIALS

The Department of the Interior is responsible for the management, conservation, and development of the Nation's natural resources to meet the requirements of national security and an expanding economy. The Department provides advice and assistance to the Office of Emergency Planning in formulating and carrying out programs for the stockpiling of strategic and critical materials. The Department of the Interior conducts research in exploration, mining, beneficiation, and metallurgy and compiles information on production and consumption for use in stockpile planning.

The Department is responsible for emergency preparedness planning with respect to strategic metals and minerals and other resources, and conducts supply-requirements studies when market conditions or other circumstances indicate problem areas in which materials are likely to be in short supply and recommends appropriate action to overcome deficiencies. The Department also administers programs to encourage the exploration, development, and mining of minerals and metals for emergency purposes.

STOCKPILE DISPOSALS

The Department cooperates in the development of long-range programs for the disposal of surplus Government stockpile inventories and conducts consultations with representatives of the interested industries. The industry views along with analyses of the market situation are carefully considered in the development of Departmental recommendations for acceptance or modification of the proposed plans.

OTHER ACTIVITIES

The Department participated actively in investigating and screening proposals by industry to expand domestic production of copper ore in response to the Government's offer to undertake negotiations with domestic producers to provide the incentive needed for obtaining additional production to meet an acute shortage of copper. The Department also cooperated in the establishment of export quotas on copper to help alleviate the domestic short supply situation.

The Geological Survey has reported the discovery of dawsonite, an aluminum-bearing mineral, in samples of oil shale collected from outcrops along the northern rim of the Piceance Basin in Colorado. This discovery significantly increases the area in which potential deposits of dawsonite might occur. Utilization of dawsonite as a by-product source of aluminum in the processing of oil shale for fuel products is under study.

Potentially large resources of the rare earths are reported by the Geological Survey in the marine phosphate rock which is mined extensively for phosphate fertilizer in Florida, Idaho, Montana, and North Carolina. The potential availability of 4,000–5,000 tons of rare

earths annually is estimated as a by-product from the millions of tons of rock used to make phosphoric acid. Apatite, the basic constituent of phosphate rock, is relatively richer than conventional rare earth sources in yttrium and the heavier rare earths such as europium, gadolinium, thulium and erbium which are particularly sought after in nuclear and electronic technology. The essentials of a recovery technology are available in established practices of the chemical industry. An economic by-product recovery process depends upon the success of research on extraction methods.

Special and technical reports, issued during July–December 1966, having a relationship to strategic and critical materials are as follows:

BUREAU OF MINES

Minerals Yearbook 1965

Preprints of individual chapters of all strategic minerals were published.

Reports of Investigation

- 6800 High-Temperature Corrosion Studies. Influence of Yttrium on Oxidation of Nickel at 1200° C
- 6808 Oxidation Leaching of Copper Sulfides in Ammoniacal Pulps at Elevated Temperatures and Pressures
- 6809 Extraction and Separation of Selected Lanthanides With a Tertiary Amine
- 6810 Piezoelectric Pulsing Equipment for Sonic Velocity Measurements in Rock Samples From Laboratory Size to Mine Pillars
- 6812 Photoelastic Study of an Internally Stressed Circular Opening in a Biaxial Stress Field
- 6813 Crystalline Titanium by Sodium Reduction of Titanium Lower Chlorides Dissolved in Sodium Chloride
- 6817 High-Energy-Rate Extrusion of Low-Density Tungsten Powder Billets
- 6822 Heats and Free Energies of Formation of Anhydrous Carbonates of Barium, Strontium, and Lead
- 6828 Nonpegmatitic Beryllium Occurrences in Arizona, Colorado, New Mexico, Utah, and Four Adjacent States
- 6834 Influence of Repetitive Electrolysis on Winning Molybdenum
- 6835 Preparation of Submicron Tungsten Powder by Hydrogen Reduction of Tungsten Hexachloride
- 6836 Density and Molar Volume of Binary Fluoride Mixtures
- 6838 Inelastic Deformation of Rock Under a Hemispherical Drill Bit
- 6841 Recovery of Additional Beryllium From Fluoferrate Leach Residue
- 6842 Yield and Ultimate Strengths of Rock Bolts Under Combined Loading
- 6845 Tungsten Recovery from Low-Grade Concentrates by Amine Solvent Extraction
- 6850 Preparation of High-Purity Molybdenum by Molten Salt Electrorefining
- 6851 Thermoelectric Properties of Yttrium Selenides and Tellurides

- 6852 Determination of Copper With Disodium Ethylenedinitrilo Tetraacetate (EDTA)
- 6853 Vapor Deposition of Molybdenum-Tungsten Alloys
- 6861 Thermodynamic Data for Molybdenum Carbide and Tantalum Carbide
- 6862 High-Temperature Heat Content of Lithium Columbate
- 6866 Intermediate Phases in the Magnesium-Cerium System Between Magnesium and $M_{85}Ce$
- 6867 Investigation of Correlation Between Assay Values and Unequal Sample Interval Lengths
- 6873 Heats of Formation of Lithium Sulfate and Five Potassium- and Lithium-Aluminum Silicates
- 6875 Electrolytic Methods for Producing Titanium and Titanium Alloys
- 6878 Electrorefining of Titanium-Nitrogen Alloys
- 6882 Electrowinning and Tapping of Lanthanum Metal

Information Circulars

- 8290 Titanium Resources of the United States
- 8298 Reconnaissance of Beryllium-Bearing Pegmatite Deposits in Six Western States, Arizona, Colorado, New Mexico, South Dakota, Utah, and Wyoming
- 8303 Manganese Occurrences in the Eureka-Animas Forks Area of the San Juan Mountains, San Juan County, Colo.
- 8307 Fluorspar Deposits of New Mexico

Professional Papers

- 550-C Geological Survey Research 1965, Chapter C. Short papers on analytical methods, economic geology, and related subjects.

Bulletins

- 1185-C The uraniferous zirconium deposits of the Pocos de Caldas Plateau, Brazil, by G. E. Tolbert.
- 1198-E Geochemical reconnaissance in the Pequop Mountains and Wood Hills, Elko County, Nevada, by R. L. Erickson, A. P. Marranzino, Uteana Oda, and W. W. Janes (zinc, lead, mercury).
